

BEHIND THE COMPLAINT

The Hidden Emotional Load of
Complaint Handling and Investigation

Emerging insights from
trauma-informed capability
building in Ombudsman and
complaint-handling
environments

Supporting the people who hear
difficult stories is not separate from
good complaint handling.
It is part of good complaint handling.

EXECUTIVE SUMMARY

Complaint handling is often understood primarily as a technical and procedural function.

Listening. Gathering information. Assessing evidence. Applying legislation, jurisdiction and policy. Investigating. Communicating decisions. Ensuring procedural fairness.

But complaint handling is also **deeply human work**.

People rarely contact an Ombudsman, integrity body or complaint-handling organisation because everything is going well.

They may arrive angry, frightened, grieving, overwhelmed or exhausted. Their experiences may involve abuse, family violence, discrimination, financial hardship, mental health crisis, institutional failure or other significant adverse experiences.

The person receiving that complaint may need to listen carefully, communicate with empathy and remain calm while simultaneously maintaining professional boundaries, impartiality and procedural fairness.

Then another complaint arrives.

And another.

This creates an often less visible dimension of complaint handling:

the emotional work required to do the work.

Research into emotional labour demonstrates that regulating emotions as part of a professional role can itself become a workplace demand and has been associated with burnout (Jeung, Kim & Chang, 2018).

Research from legal, judicial, child-protection and other trauma-exposed professions also demonstrates that people do not need to directly experience a traumatic event to be affected by repeated occupational exposure to the trauma of others.

Australian work health and safety guidance similarly recognises **witnessing, investigating or being exposed to traumatic events or material** as a psychosocial hazard. Comcare explicitly recognises both vicarious exposure to another person's trauma and cumulative exposure occurring on multiple occasions.

Through TIPT's trauma-informed capability-building work within Ombudsman environments, recurring themes have emerged around these emotional and psychological demands.

Participants have described emotional heaviness, exhaustion, isolation, difficulty establishing boundaries, intrusive thoughts, changes in worldview and carrying distressing material beyond working hours.

These observations raise an important question:

Who supports the people who spend their working lives listening to what has gone wrong?

This Practice Insight explores the hidden emotional load associated with complaint handling and investigation and considers what this may mean for organisations seeking to manage compassion fatigue, burnout, vicarious trauma and psychosocial risk.

Its central proposition is simple:

Supporting the people who receive difficult stories is not separate from good complaint handling. It is one of the conditions that helps make good complaint handling sustainable.

Three things this Practice Insight Explores

1. The hidden emotional load of complaint work

Complaint handling and investigation can involve repeated exposure to distress, trauma, anger, injustice and complex human experiences. This paper considers how that cumulative emotional exposure may contribute to compassion fatigue, burnout, vicarious trauma and other psychosocial risks.

2. What is emerging through practice

Across TIPT's capability-building work in Ombudsman environments, recurring themes have emerged around emotional exhaustion, carrying difficult stories beyond work, withdrawal, changing perceptions of safety, pressure to keep going and the challenge of maintaining empathy while protecting personal wellbeing.

3. What sustainable protection can look like

Supporting workers requires more than individual resilience or self-care. This paper considers protection across three interconnected levels — **Individual Capability, Protective Teams and Responsive Systems** — and explores practical implications for leaders and organisations.

Evidence approach

This Practice Insight draws on recurring, de-identified themes observed through TIPT's trauma-informed capability-building work within Ombudsman environments. These observations are practice-based and should not be interpreted as formal research findings or as representative of every employee or complaint-handling environment.

The emerging themes are considered alongside peer-reviewed research from comparable trauma-exposed professions and contemporary Australian work health and safety guidance, including Safe Work Australia and Comcare.

1. Complaint Handling is Human Work

Effective complaint handling requires considerable professional capability.

Practitioners may need to:

- listen to complex and sometimes traumatic accounts;
- communicate with people experiencing significant distress;
- manage anger, aggression and escalation;
- remain impartial;
- establish appropriate boundaries;
- analyse complex information;
- communicate decisions people may not want to hear;
- manage expectations about what their organisation can and cannot do; and
- transition quickly from one emotionally demanding matter to another.

Many of these requirements involve **emotional labour**.

The complaint handler may need to regulate their own emotional response while simultaneously responding appropriately to the emotions of somebody else.

Jeung, Kim and Chang's review of emotional labour and burnout describes emotional labour as an important occupational stressor and examines its relationship with burnout.

For complaint handlers, this creates an interesting paradox.

Many of the characteristics that can make someone highly effective at complaint handling — empathy, curiosity, persistence, listening, fairness and a strong desire to help — may also contribute to the emotional demands associated with the work.

The objective should therefore not be to make complaint handlers **less empathetic**.

It should be to create working environments in which empathy can be **sustained safely**.

Practice insight

Complaint handlers should not have to choose between **caring about the person** and **protecting themselves from the cumulative impact of caring**. Sustainable complaint handling requires both human connection and protective conditions around the work.

2. About these Practice Insights

This publication draws upon recurring themes observed through TIPT's trauma-informed capability-building work within Government and Ombudsman environments.

Capability-building activities have explored compassion fatigue, burnout, vicarious trauma, emotional regulation, psychological safety, recovery, mental health conversations, boundaries and trauma-informed debriefing.

LEGO® Serious Play® has also been used to support participants to externalise complex experiences and explore what emotional load, compassion fatigue, burnout and vicarious trauma can look and feel like in their working lives.

Across separate cohorts, participants independently described remarkably similar experiences.

These included feeling:

weighed down

overwhelmed

isolated

drained

crushed by responsibility

unable to switch off

and

responsible for continuing to help others despite feeling depleted themselves.

Participants also described the impact that repeated exposure to distress could have on relationships, connection with colleagues and perceptions of the world outside work.

Practice insight

DIFFERENT COHORTS. REMARKABLY SIMILAR EXPERIENCES.

Across separate capability-building groups, participants independently described feeling weighed down, depleted, isolated and unable to fully switch off from the emotional demands of their work

3. A Trauma-Informed Lens

Trauma-informed complaint handling looks both ways

Trauma-informed complaint handling appropriately places considerable attention on the experience of the person making the complaint.

Does the person feel safe?

Do they understand what will happen?

Are expectations transparent?

Are they provided with appropriate voice and choice?

Are interactions respectful?

Is unnecessary re-traumatisation avoided?

These questions matter.

But there is another person in the interaction.

The person receiving the complaint.

A sustainable trauma-informed complaint environment therefore needs to look in **both directions**.

For the complainant

Safety • Cultural Safety • Trust • Choice • Collaboration • Empowerment

For the complaint handler

Psychological Safety • Boundaries • Support • Reflection • Recovery • Sustainable Empathy

These are not competing priorities.

Protecting the psychological health of complaint handlers can strengthen the conditions that enable people to remain patient, curious, fair and compassionate with the people they support.

TIPT
FRAMEWORKS™

The TIPT Trauma Informed Framework

Understanding Trauma. Creating Safety. Enabling Wellbeing.

TIPT Trauma-Informed Framework™

The TIPT Trauma-Informed Framework™ provides a lens for considering safety, trust, collaboration, empowerment, choice and cultural responsiveness. Within complaint-handling environments, these principles can inform both the experience of the complainant and the organisational conditions surrounding the people receiving and responding to complex complaints.

4. The Hidden Emotional Load

Across separate capability-building cohorts, participants used strikingly similar language and imagery when describing compassion fatigue, burnout and vicarious trauma.

People described feeling:

**buried • crushed • wilted •
stuck • flat • broken • washed
out • weighed down**

These experiences suggest that the psychological impact of complaint work may not always arise from one extraordinary event.

Instead, emotional load can accumulate.

**One difficult conversation.
One confronting file.
One distressed complainant.
One escalation.
Then another.**

This concept of cumulative exposure is well recognised beyond complaint-handling environments.

Molnar et al.'s systematic review examined vicarious traumatisation among child-welfare and child-protection professionals. The literature describes potential mental, physical, emotional, social and work-related consequences associated with witnessing the trauma of others.

Importantly, similar issues have been identified in professional environments outside traditional therapeutic roles.

Iversen and Robertson's systematic review examined secondary trauma in legal professionals, while Australian authors Scott and Freckelton have considered vicarious-trauma risk among legal practitioners and judicial officers.

These professions are not identical to complaint handling. However, they demonstrate an important principle:

Occupational exposure to trauma does not require personally experiencing the original traumatic event.

Australian WHS guidance makes this particularly relevant to complaint and investigation environments.

Comcare identifies witnessing, investigating or being directly exposed to traumatic events or material as a psychosocial hazard and explicitly recognises both **vicarious** and **cumulative** exposure.

For complaint-handling organisations, the question therefore may not simply be:

Was this particular complaint traumatic?

It may also be:

How much distressing material is this person encountering?

How frequently?

For how long?

And what other psychosocial demands are occurring at the same time?

EMERGING THEME 01

Carrying the Weight of Other People's Problems

A recurring theme involved the feeling of carrying responsibility for other people.

Participants described feeling obligated to continue helping despite their own exhaustion.

One cohort described the experience as:

A never ending “merry-go-round” of compassion.

There was always somebody else requiring care, but insufficient opportunity to prioritise themselves.

Others described:

“Feeling like it was a choice between themselves and the others they were supporting.”

This pattern raises an important distinction.

Empathy is not the problem.

Empathy, listening, curiosity and compassion are fundamental professional capabilities.

The risk emerges when sustained empathic engagement occurs without adequate opportunities for boundaries, recovery, supervision and support.

The broader vicarious-trauma literature reinforces the importance of considering repeated indirect exposure to the traumatic experiences of others rather than viewing occupational trauma solely through the lens of direct exposure.

The organisational question therefore becomes:

How do we protect people's capacity to care without asking them to stop caring?

Why this matters?

The emotional impact of complaint work should not be treated solely as an individual wellbeing issue. When employees are repeatedly required to absorb distress, maintain empathy and continue supporting others, organisations need to consider the conditions that make that care sustainable — including workload, boundaries, recovery, supervision and psychologically safe support.

EMERGING THEME 02

The Complaint That Comes Home with You

One of the clearest recurring themes concerned the difficulty of transitioning between professional and personal life.

Participants described distressing material replaying in their minds.

Some spoke about carrying the emotional residue of combative interactions.

Others identified traumatic material involving children and other highly distressing circumstances as particularly difficult to leave behind.

One group described the experience of vicarious trauma as having:

“A foot in two worlds.”

The ordinary world of home and family —and another, darker world created through occupational exposure to trauma.

Participants also described changes in worldview, including changes in their perceptions of safety, trust and risk outside work.

Research within legal environments provides a useful comparison. Secondary and vicarious trauma have been examined among lawyers, solicitors, attorneys, judges and other legal professionals whose work brings them into repeated contact with traumatic narratives and material.

The significance of these findings for Ombudsman and Government environments requires further research.

However, the parallels warrant consideration.

Comcare's guidance is also relevant. It recognises that traumatic-material exposure may be vicarious or cumulative and that repeated work-related exposure increases risk.

Exposure does not necessarily end when the file closes. Sometimes the story travels home.

Why this matters?

The transition between work and home is not simply a personal wellbeing issue. When work involves repeated exposure to distressing stories, traumatic material or emotionally demanding interactions, organisations should consider how **work design, recovery opportunities, supervision and team practices** can help employees psychologically transition out of the working day.

Recovery should not begin only after someone gets home.

The Transition Space

Participants identified the transition between work and home as particularly important.

Some used exercise.

Others used nature, pets, reading, family, gardening or time at the beach.

One participant described using the commute home to complete a mental “brain dump” of unfinished tasks followed by several minutes of meditation before arriving home.

But participants also identified barriers:

deadlines • workload • phones • emails • family responsibilities • pressure to stay on top of work • distressing material replaying in their minds

Recovery therefore cannot simply be framed as something employees should undertake in their own time.

If work creates the exposure, work also has a role in creating conditions that enable recovery.

The Transition Space

EMERGING THEME 03

Withdrawal When Connection May Be Needed Most

Another recurring pattern involved **disconnection**.

Participants described withdrawing from colleagues and family, feeling isolated, becoming shorter-tempered, experiencing increased conflict and wondering whether anybody else was experiencing similar reactions.

One cohort described:

“Knowing that help was available, but that there was a huge wall in the way of getting that help.”

This creates an important paradox:

As emotional load increases, people may withdraw from precisely the relationships that could help protect them.

This is where psychological safety becomes particularly important.

Edmondson's foundational research describes team psychological safety as a shared belief that a team is safe for interpersonal risk-taking. Her research demonstrated an association between psychological safety and learning behaviour within teams.

In emotionally demanding complaint environments, interpersonal risk-taking might look like:

That matter affected me.

I'm finding this difficult.

I need a break.

I'm having trouble getting that story out of my head.

Can we talk about what happened?

Each statement involves vulnerability.

If employees believe acknowledging emotional impact will cause them to be perceived as weak, incapable or unsuitable for complex work, important psychosocial risks may remain hidden.

And hidden risks are considerably harder to manage.

Why this matters?

Emotionally demanding work does not always result in an immediate or visible response. **The impact can accumulate over time.**

Repeated exposure to distress, conflict and traumatic material can gradually affect a person's capacity to recover, maintain perspective and remain connected to the parts of their life that help protect them.

The handwritten reflections in this build — “Weight I cannot get up” and “Unable to see beyond wall – help” — are particularly powerful because they show how emotional load can begin to affect not only how someone feels, but **what they can see as possible when they are depleted.**

When the load becomes too heavy, people may not simply need more resilience. They may need some of the load to be removed.

EMERGING THEME 04

When You Care – But Cannot Fix It

Complaint handlers operate within boundaries.

Jurisdiction.
Legislation.
Evidence.
Policy.
Procedural fairness.
Organisational powers.

A complaint handler may understand why somebody is distressed while still being unable to provide the outcome that person wants.

Across more than one capability-building cohort, participants described frustration associated with:

“Hitting a brick wall.”

This was sometimes described in relation to other organisations or systems that participants perceived as unable or unwilling to respond in the way they hoped.

One cohort also raised the concept of **moral injury** during its discussion of vicarious trauma.

This does not establish that moral injury is occurring across complaint-handling professions, and further research would be required before drawing that conclusion.

It does, however, raise an important practice question about moral and emotional distress.

What happens when someone cares deeply about fairness, can see the distress being experienced by another person, but is constrained in what they can do?

The internal tension may become:

I understand why this matters to you.
I care about what has happened.
But I cannot necessarily fix it.

Trauma-informed practice does not remove professional boundaries, jurisdiction or impartiality.

Instead, it asks how dignity, transparency, fairness and human connection can be maintained alongside them.

Why this matters?

Complaint handlers can care deeply about fairness and the person in front of them while still being constrained by **jurisdiction, evidence, legislation and organisational authority**.

When people repeatedly encounter situations they believe should be different but have limited capacity to change, the emotional demand of the work can extend beyond simply managing difficult conversations.

Organisations can help by creating space for employees to **acknowledge frustration, reflect on what is within their control, maintain healthy professional boundaries and reconnect with the value of what they *can* influence.**

Being unable to fix the problem does not mean the interaction has no value. Sometimes fairness, dignity, clarity and being genuinely heard are what the complaint handler can still provide.

EMERGING THEME 05

When Professionalism Hides the Impact

Complaint-handling professionals are often highly skilled at remaining composed.

That does not mean difficult interactions have no impact.

Participants described continuing despite exhaustion, masking how they felt and experiencing pressure to keep going.

One reflection captured this particularly clearly:

“Knowing that even though you were struggling, the work demands kept piling up.”

This raises an important organisational question:

Could professional competence sometimes make psychological distress harder to see?

An experienced employee may continue answering calls, completing investigations, meeting deadlines and managing distressed complainants while simultaneously experiencing considerable cumulative emotional load.

Waiting until performance visibly deteriorates may therefore mean waiting too long.

This also challenges simplistic conversations about **resilience**.

Resilience should not become shorthand for:

“Tolerate more.”

“Don't let it affect you.”

“Push through.”

or

“Become better at coping with an unsafe level of exposure.”

Individual capability matters. But individual capability is only **one layer of protection**.

Why this matters?

Professional competence can make emotional strain difficult to see.

Complaint handlers may continue meeting deadlines, responding to people, managing competing priorities and maintaining professional standards even while feeling increasingly overwhelmed or depleted.

The reflections represented in this build — **“weight of professional responsibility,” “too many things going”** and **“trying to fight fires”** — illustrate how significant pressure can sit behind continued professional performance.

If organisations rely only on visible performance problems as an indication that someone is struggling, important warning signs may be missed.

Looking capable does not necessarily mean someone is coping.

Sometimes professionalism is what makes the load hardest to see.

6. From Resilience to Protection

People benefit from understanding compassion fatigue, burnout and vicarious trauma.

They benefit from recognising warning signs, developing emotional-regulation strategies, establishing boundaries, understanding recovery and knowing when and how to seek support.

There is also evidence that capability-building interventions can play a role.

Kim et al.'s scoping review identified interventions including psychoeducation, mindfulness approaches, arts and recreational programs and other strategies. The authors found promising outcomes in some areas but also highlighted limitations in the evidence and called for greater attention to **organisational-level interventions**, rather than relying predominantly on self-care approaches.

That distinction is critical.

Training is part of protection. It is not a substitute for organisational protection.

Australian WHS guidance similarly takes a systems-based approach.

Safe Work Australia's Model Code of Practice states that PCBU's must eliminate psychosocial risks or, where elimination is not reasonably practicable, minimise them so far as reasonably practicable.

This suggests sustainable protection needs to operate at more than one level.

TIPT Three Layers of Protection™

Supporting people working with complaints, trauma and emotional complexity

1 | INDIVIDUAL CAPABILITY

I understand. I notice. I take care.

Understanding compassion fatigue, burnout and vicarious trauma.

Recognising personal warning signs.

Developing emotional regulation and recovery strategies.

Establishing healthy boundaries.

Knowing when and how to seek support.

Creating healthier transitions between work and home.

2 | PROTECTIVE TEAMS

I see you. I support you. We're in this together.

Creating psychological safety to talk about impact.

Checking in following difficult matters.

Providing and accepting peer support.

Using trauma-informed reflective conversations.

Normalising help-seeking.

Creating permission to ask for a break.

Building collective rather than solely individual responsibility for wellbeing.

3 | RESPONSIVE SYSTEMS

We design the conditions. We remove barriers. We lead.

Managing cumulative exposure.

Monitoring workload and job demands.

Providing quality supervision.

Considering diversification or rotation of highly traumatic work where appropriate.

Creating access to support and recovery.

Establishing realistic expectations.

Providing psychologically safe escalation pathways.

Consulting employees about psychosocial hazards and controls.

Reviewing whether organisational systems unintentionally reward “pushing through”.

**Individual Capability + Protective Teams +
Responsive Systems = Sustainable Protection**

TIPT
FRAMEWORKS™

TIPT Three Layers of Protection™

People do their best work when they are supported on every layer.

Supporting people working with complaints, trauma and emotional complexity

Protection is strongest when we build it together.

Three layers. One purpose: enabling people to care, safely and sustainably.

7. Workers Cannot Self Care Their Way Out of an Organisational Psychosocial Risk

Self-care matters.

Emotional regulation matters.

Exercise matters.

Boundaries matter.

Connection matters.

Recovery matters.

But none of these replaces organisational risk management.

Safe Work Australia's Model Code provides practical guidance for managing psychosocial hazards and places the responsibility within the established WHS risk-management framework.

Comcare identifies witnessing, investigating or being exposed to traumatic material as a psychosocial hazard and recognises that repeated work-related exposure increases the likelihood of harm.

This moves the conversation beyond:

How do we make our people more resilient?

toward:

How do we design complaint-handling environments in which people can sustainably perform emotionally demanding work?

This may require consideration of:

- cumulative exposure to traumatic material;
- workload and job demands;
- allocation of particularly distressing matters;
- quality and availability of supervision;
- opportunities for recovery;
- leadership capability;
- psychologically safe escalation pathways;
- aggression and abusive behaviour;
- team culture;
- consultation with workers; and
- whether organisational expectations unintentionally reward pushing through.

The strongest response is therefore not:

Individual OR organisational.

It is:

Individual AND team AND organisational.

8. Trauma Informed Debriefing and Reflection

What happens after the difficult conversation?

Complaint-handling organisations understandably need to learn from complex incidents.

Following a difficult interaction, managers may need to ask:

What happened?

What did we learn?

What should we do differently next time?

Those questions can be important.

But they do not necessarily need to be the **first questions**.

During capability-building activities, participants explored scenarios involving highly distressing interactions, including supporting a colleague following a complainant threatening suicide.

The discussion highlighted the importance of first considering:

Are you okay?

What do you need right now?

Do you need a break?

Is there somebody you would like to talk to?

Are you okay to go home?

Operational reflection can follow.

A trauma-informed approach recognises that the immediate human response and the subsequent operational learning process do not have to occur simultaneously.

**PEOPLE FIRST → REFLECTION SECOND → LEARNING
THIRD**

Psychological safety is important here too.

Meaningful reflective conversations require employees to be able to say:

I wasn't okay after that call.

That affected me.

I need support.

without fearing negative professional consequences.

9. Creating Safer Spaces for Reflection

Psychologically safe reflection requires more than simply putting people in a room and asking them to talk.

TIPT's Third Space Framework™ considers conditions that support safer reflection and dialogue through:

Equal Voice

→ Psychological Distance

→ Shared Storytelling

→ Shared Mental Models

→ Collective Reflection

Within complaint-handling environments, these principles can support reflective practice, team conversations and capability building by creating ways to explore difficult professional experiences without requiring unsafe levels of personal disclosure.

10. What Organisational Protection Can Look Like

The evidence and practice observations considered in this paper point toward several areas organisations may wish to examine.

UNDERSTAND EXPOSURE

Identify roles involving repeated exposure to distressing narratives, traumatic material, aggression or emotionally demanding interactions.

Consider frequency, severity and duration — not simply caseload.

DESIGN RECOVERY INTO WORK

Consider what happens between highly demanding matters.

Examine whether workload allows meaningful psychological transition and recovery.

STRENGTHEN SUPERVISION

Provide access to appropriate supervision for people regularly working with distressing material.

BUILD LEADER CAPABILITY

Equip leaders to recognise changes in behaviour, withdrawal, emotional exhaustion and other possible signs that someone may be struggling.

CREATE PSYCHOLOGICAL SAFETY

Ensure employees can acknowledge when work has affected them without believing that doing so will be interpreted as professional weakness.

REVIEW EXPOSURE

Where appropriate and reasonably practicable, consider whether sustained exposure to particularly distressing material can be reduced or diversified.

BUILD COLLECTIVE CARE

Peer connection can be protective, but organisations should not leave support entirely to informal relationships.

LISTEN TO WORKERS

Ask:

What parts of this work affect you most?

What helps?

What gets in the way of recovery?

What could we change?

The people doing the work often have considerable insight into where the pressure points exist.

11. What Participants Told Us About Capability Building

Evaluation findings across TIPT capability-building cohorts suggest that employees value being given practical language and strategies for understanding emotionally demanding work.

Following one July workshop:

95%

reported increased knowledge of compassion fatigue, burnout and vicarious trauma.

100%

reported increased confidence in having a mental health conversation with a colleague.

100%

reported increased confidence applying recovery or “drain off” strategies.

100%

reported increased confidence conducting a trauma-informed debrief following an upsetting incident.

A second July cohort reported increased confidence across these capability areas.

An earlier cohort also demonstrated substantial reported learning gains, with **90% reporting a 30–100% increase in understanding** of compassion fatigue, burnout and vicarious trauma.

These results should not be interpreted as evidence of long-term behavioural or organisational change.

People value being given language, permission and practical tools to understand the emotional demands of their work.

One participant captured another important benefit of collective reflection:

“It was surprising how similar we all felt.”

Sometimes recognising that an experience is shared is itself an important step toward reducing isolation.

12. Questions worth asking FOR LEADERS

EXPOSURE	Do we understand which roles carry the greatest cumulative exposure to distressing material?
PSYCHOLOGICAL SAFETY	Can employees safely say that a matter affected them without fearing professional judgement?
RECOVERY	Does the way work is designed allow meaningful recovery between highly demanding matters?
SUPERVISION	Do people have access to quality supervision and psychologically safe reflective conversations?
SYSTEMS	Are we relying too heavily on individual resilience or EAP as our primary controls?

Who is supporting the people who support everyone else?

Final Reflection

Behind every complaint is more than one human story.

Complaint handlers occupy a unique professional space.

They frequently meet people after trust has been damaged.

Something important has gone wrong.

Someone believes they have not been heard.

They may listen to some of the most difficult experiences in people's lives.

And they must remain fair.

They must remain curious.

They must remain professional.

They must maintain boundaries.

Sometimes they must explain that the outcome somebody desperately wants cannot be provided.

Then the next complaint arrives.

Research across legal, judicial, child-protection and human-service professions demonstrates that repeated occupational exposure to the trauma and distress of others can carry psychological consequences.

Australian WHS guidance also recognises witnessing, investigating and exposure to traumatic material as a workplace psychosocial hazard, including vicarious and cumulative exposure.

The practice insights emerging through TIPT's work suggest that these questions warrant serious consideration within complaint-handling environments too.

This is not about pathologising complaint work.

Nor is it about suggesting that employees are unable to manage difficult situations.

It is about recognising:

EXPOSURE

ACCUMULATION

EMOTIONAL LABOUR

RECOVERY

ORGANISATIONAL RESPONSIBILITY

Psychologically healthy complaint environments cannot be built solely through individual resilience.

They require:

CAPABLE INDIVIDUALS

PROTECTIVE TEAMS

RESPONSIVE SYSTEMS

Because protecting the people who hear difficult stories is not separate from good complaint handling.

It is part of good complaint handling.

About TIPT

TIPT provides trauma-informed capability building, training and advisory services across complex and emotionally demanding professional environments.

TIPT's work explores the intersection between trauma-informed practice, psychosocial safety, psychological safety, communication and sustainable human capability.

Through experiential and evidence-informed approaches, including LEGO® Serious Play®, TIPT supports organisations and teams to build practical capability for responding to distress, navigating complex conversations and protecting the people whose roles require them to support others.
